

# Table triggers

Triggers get executed when a certain event occurs

**OnInsert()**: Gets triggered when record is inserted

**OnModify()**: Gets triggered when record is modified

**OnDelete()**: Gets triggered when record is deleted

**OnRename()**: Gets triggered when primary key value is changed

# Page Triggers

**OnOpenPage():** Gets executed when a page is opened

**OnAfterGetCurrRecord():** Gets executed once the selected record is retrieved

**OnAfterGetRecord():** This trigger is independent of the currently selected record in the UI. When it gets raised depends on when the UI needs to load more data and the block size of the data read. So, for example, in a list page, where rows are read in larger blocks, then the OnAfterGetRecord trigger will be raised for each of the records read before the page is shown.

**OnQueryClosePage():** Gets executed when the page gets closed before  
OnClosePage

**OnClosePage():** Gets executed when the page gets closed
