

## Options Vs Enums

Options is a zero based enumerator type: therefore, you can covert option values into integers.

You need to use comma - separated list after your variable definition

```
var color: Option Green, Red, Yellow;
```

If you want to reuse the same option in other objects, you have to redefine all the available values.

Options in table are not extensible with the table extension

A better approach would be to use enum object. An enum is a separate object with its own name and number. An enum object can be extended
