Variable functions

When you run the code in BC, variables are initialized with their default values

To re initialize or to reset the values in a variables we can use

Clear()

ClearAll()

Evaulate(): You can use the evaluate() function to covert a variable of text data type to another variable of another type

Format(): The format function converts a data type into text datatype

System Functions

System Functions are the functions that you can use out of the box

UserId()

CompnayName()

Today()

Time()

Workdate()
